RADIATION PROTECTION AND SHIELDING STANDARDS FOR THE 1980s*

D. K. Trubey

Engineering Physics Information Centers
Oak Ridge National Laboratory
Oak Ridge, Tennessee

The American Nuclear Society (ANS) is a standards-writing organization member of the American National Standards Institute (ANSI). The ANS Standards Committee has a subcommittee denoted ANS-6, Radiation Protection and Shielding, whose charge is to develop standards for radiation protection and shield design, to provide shielding information to other standards-writing groups, and to develop standard reference shielding data and test problems. This paper is a progress report of this subcommittee. Significant progress has been made since the last comprehensive report¹ to the Society.

The purpose of a standard is to set forth acceptable practices, procedures, dimensions, material properties, specifications, etc., that have been agreed on by representatives of a broad segment of the subject activity. Ideally, because of the standardization process, a standard is a high-quality, highly-reliable, comprehensive summary of the state of the art.

The organization responsible for promulgating voluntary standards is ANSI. The Institute, a nonprofit corporation, is a federation of leading trade, technical and professional organizations, government agencies, and consumer groups. ANSI's principal functions are to coordinate standards development, minimize duplication and overlap, and provide a neutral forum to consider and identify standards needs.

The standards-writing organization of interest here is the ANS. Among its committees is one on standards composed of a steering committee and several subcommittees. The subcommittees, in turn, have established ad hoc working groups for preparation of individual standards.

The subcommittee on shielding standards, ANS-6, now composed of nine working groups, was established in 1964. The goals and accomplishments of the working groups are briefly described below.

*Work partially supported by the U.S. Nuclear Regulatory Commission, and prepared by the Oak Ridge National Laboratory, operated by the Union Carbide Corporation for the Department of Energy under UCC Contract No. W-7405-eng-26.

ANS-6.1: Shielding Cross Section Standards

The first standard developed by the cross-section working group provides a reference set of neutron and gamma-ray flux-to-dose-rate factors for use by shielding design engineers.² This standard will be revised in the near future.

Current efforts of the working group are directed toward developing a standard to establish criteria for standard sets of multigroup cross sections to be used for radiation protection calculations. A draft is now in the review process. The group is also testing candidate data sets which appear to meet the criteria and therefore can be considered to be standard reference data.

ANS-6.2: Benchmark Problems

The primary objective of the benchmark problems effort is to compile in convenient form a limited number of well-documented problems in radiation transport which will be useful in testing computational methods used in shielding.

Four problem solutions were published in 1969 in loose-leaf form by the Radiation Shielding Information Center. Revisions were issued in 1970 and 1974. The work slowed for a period, but now additional problems are being developed, including several for typical reactor configurations. The group now is collecting and evaluating solutions to two problems specifying PWR shielding configurations and a problem which defines a radwaste configuration.

ANS-6.3: Shield Performance Evaluation

The initial goal of this group was attained in 1972 with the publication of ANSI N18.9-1972. The group has developed a replacement standard which has now been published and is titled "Program for Testing Radiation Shields in Light Water Reactors," ANSI/ANS-6.3.1-1980.

ANS-6.4: Shield Materials

The first major effort of this group resulted in a guide for the design of concrete shields for nuclear power plants and similar applications.³

The group has since worked to develop a standard on compensatory shielding materials, i.e., special materials to be used in shield penetrations to compensate for the reduction in effectiveness of the bulk shield.

A more recent project has been undertaken to develop standard reference buildup factor data for selected materials. A need for reliable low-energy data is especially recognized. These data are frequently used by design engineers in point kernel calculations.

ANS-6.5: Shielding Nomenclature

The group developed a glossary for use in radiation protection and shielding which was published in 1979.⁴ The document also includes definitions of reactor physics terms, compiled by ANS-19.2, and a power reactor systems glossary, compiled by ANS-50. The glossary was issued for trial use, and comments are desired by the group to use in developing succeeding drafts.

ANS-6.6: Calculation and Measurement of Direct and Scattered Radiation from Nuclear Power Plants

The group has developed a standard which defines calculational requirements and measurement techniques to estimate exposures near nuclear power plants due to direct and scattered radiation from contained sources on site.⁵ Nitrogen-16 gamma-rays are a prime consideration.

ANS-6.7: Radiation Zoning for Design of Nuclear Power Plants

The proposed standard, "Radiation Zoning for Design of Nuclear Power Plants," has been sent to the Nuclear Power Plant Standards Committee for approval as an ANSI standard.

The group now is reorganizing and is in the process of determining the scope of a project to establish zoning standards for design of shielding which takes account of possible reactor accident conditions.

ANS-6.8: Location and Range of Detection of Area and Process Fluid Radiation Monitoring Systems for Nuclear Steam Generating Plants

Organized in early 1975 as a joint project with the Health Physics Society Standards Committee, the group has developed a standard titled "Location and Design Criteria for Radiation Monitoring Systems for Light Water Nuclear Reactors." Approved by ANSI in May 1981, it is designated ANSI/ANS/HPSSC-6.8.1-1981.

The group is now working on a companion standard on continuous process and effluent radiation monitoring systems.

ANS-6.9: Designing for Postaccident Radiological Conditions

A new working group was organized in late 1981 to develop one or more standards to provide guidance in designing for postaccident radiological conditions which can arise at LWR power plants.
