Sludge Stabilization Campaign Blend Plan

I. INTRODUCTION

This Sludge Stabilization Blend Plan documents the material to be processed and the order of processing for the FY95 Sludge Stabilization Campaign. The primary mission of this process is to reduce the inventory of unstable plutonium bearing sludge. The source of the sludge is residual and glovebox floor sweepings from the production of material at the Plutonium Finishing Plant (PFP). The reactive sludge is currently being stored in various gloveboxes at PFP. The sludge is to be thermally stabilized in a glovebox in room 230A of the 234-5Z building and material handling for the process will be done in room 230B of the same building. The campaign is scheduled for approximately 10 months. A total of roughly 22.5 kg of Pu will be processed.

II. MATERIAL TO BE PROCESSED

There are two types of the plutonium bearing material that will be thermally stabilized in the muffle furnace: Plutonium Reclamation Facility (PRF) sludge and Remote Mechanical C (RMC) Line material.

PRF Sludge (Table 1)

Items included in PRF sludge group are centrifuge, PRF glovebox and canyon sludges. Since tributyl phosphate (TBP) is used as the extractant in the PRF process, all sludge items that originated in PRF have the potential to contain TBP. If the items have not already been sampled for organic content they will be sampled prior to being introduced into the furnaces. Items that contain greater than 2% organic (TBP) will not be fed into the furnaces. Although the centrifuge sludges may not have directly come from the PRF process, due to being in the PRF gloveboxes a possibility of contact with organic could have occurred and the material will be processed under the PRF program.

TOTAL ITEMS: 145
TOTAL Pu (Kg): 11.5

Sludge Stabilization Campaign Blend Plan

II. MATERIAL TO BE PROCESSED (cont.)

RMC Line Material (Table 2 and 3)

The second type of material originated in the RMC Line. Since there is no TBP used in the RMC Line process it is assumed that these items do not contain TBP. These type of items include plutonium fluoride, plutonium oxide, and plutonium oxalate (plutonium oxycarbonate). The items from the RMC Line will be separated into two different groups, RMC Oxalate (Table 2) and RMC Oxide (Table 3).

TOTAL ITEMS for RMC Oxalate: 41	TOTAL ITEMS for RMC Oxide: 47
TOTAL Pu (Kg): 6.5	TOTAL Pu (Kg): 4.5

Sludge Stabilization Campaign Blend Plan

III. PROCESS ORDER BASIS (Includes Assumptions and Current Restrictions)

A. Safety

1. 232-Z Unreviewed Safety Question is resolved.
2. Overall goal is to improve safety posture by getting reactive materials in stable forms and into vaults. Current reactive material being stored in V-174 in vent containers should be processed towards the beginning of the processing campaign to reduce the reactive scrap in the vaults. It is also preferable to process items out of any glovebox that is not seismically qualified towards the beginning of the campaign.

B. Security

1. Room 230A and Room 230B and the 213 MBA must be kept within current security categories. Room 230A and 230B are in Category III, the 213 MBA is in Category II. To help maintain current security categories, as much as possible of the Category C material in MBA 213 should be processed towards the beginning of the campaign. Two large items in the 213 MBA must be processed first to reduce inventory and not increase the security category.
2. Reduce Category C material in PRF to improve security posture.

C. Laboratory

1. OSR 5.22 restricts the PFP Laboratories (Analytical, Standards, and PPSL) to 12,450 g Plutonium (Pu) of which not more than 5,250 grams may be greater than 10% Pu²⁴⁰. The Analytical Laboratory is further limited to 2,250 grams of 10% ²⁴⁰Pu.

There are 16 items which contain 11.5% ²⁴⁰Pu which must be sampled for percent organic before processing. In addition, all PRF items designated in Table 1 must be sampled for organic and the slip-lid cans must have an Loss On Ignition (LOI) test performed before being shipped to the vaults for long term storage. To free up room in the Analytical Labs to allow for Loss On Ignition (LOI) samples and PRF sludge item organic samples to be run, material (400 grams of Category C) from the analytical laboratories needs to be received into MBA 213 for storage/processing through the furnaces.

Sludge Stabilization Campaign Blend Plan

III. PROCESS ORDER BASIS (Cont.)

D. Requirements for Processing

1. Approximately 115 of the PRF items will need to be sampled for percent organic before being processed.

E. ALARA (As Low As Reasonably Achievable)

1. The daily Operating Instructions (OI) should take into consideration good ALARA practices to keep radiation dose and handling of the items to a minimum. This would include processing items from the same pedestal/location at the same time.

Sludge Stabilization Campaign Blend Plan

IV. PROCESS ORDER

1. Item 5-91-02-02 (NOTE: Inspection of material by engineering is required before processing.)
Basis: B.1
2. Item 5-91-02-04 (NOTE: Inspection of material by engineering is required before processing.)
Basis: B.1
3. Receive item from analytical laboratories of approximately 400 grams for storage/processing.
Basis: C.1
4. Process the following category 5 items in Room 230A and Room 230B.
 - 5-89-07-55
 - 5-94-07-13
 - 5-94-07-16(NOTE: Inspection of material by engineering is required before processing.)
Basis: B.1
5. Process the following category 10 items in MBA 213.
 - 10-88-11-359
 - 10-89-05-29
 - 10-88-11-357Basis: B.1
6. Process the following items stored in V-174, marked by * in TABLES 1, 2, and 3. Exact order of processing will be specified in the daily Operating Instructions (OI). All PRF type items must be sampled for organic with sample results <2% before processing.
Basis: A.2/D.1
7. Process the following category 5 items in PRF.
 - 5-91-02-01
 - 5-91-02-03(NOTE: Inspection of material by engineering is required before processing.)
Basis: B.2

Sludge Stabilization Campaign Blend Plan

IV. PROCESS ORDER (cont.)

8. Process the remaining items. Items are found in Tables 1, 2, and 3. Exact order of processing will be specified in the OI. All PRF type items must be sampled for organic with sample results <2% before processing. Receive 400 to 800 grams of material from the Analytical Laboratory. Engineering must evaluate the material before it is received for processing.

Basis: A.2/D.1/E.1

TABLE 1 - PRF SLUDGE

NOTE :

- These items will be run as PRF Sludge under Furnace program Pnr1
- The following Centrifuge Sludge will be run as PRF sludge due to being stored/centrifuged in PRF.
- * - Identifies reactive material being stored in V-174.
- S - Identifies material that will need to be sampled for percent organic before being processed.

TABLE 2 - RMC OXALATE

NOTE:

- These items will be run as RMC Oxalate under Furnace program Pnr2
- * - Identifies reactive material being stored in V-174.
- I - Identifies material that will need to be inspected by engineering to determine if it can be run as RMC Oxalate or if it will need to be sampled for percent organic and run as PRF SLUDGE.
